

The key points of an IT Business Continuity Plan should include:

Mobile units and departmental collaboration

On-line recovery for instant access

Workplace recovery

Centralised data to remove the risk of lost data on local machines or lack of access to local machines

Enterprise level security and encryption

Data replication with the ability to deliver that data to a live working environment across all users

The ability to return to the pre-interruption state

Business e-mail continuity

The ability to test the recovery plan

Meet legal requirements of data protection

Putting in place measures such as these will mitigate the commercial risks of:

Financial losses

Loss of market share

Loss of productivity

Legal disputes

Negative publicity
